## INTRODUCTION

25X1D The probable missile production plants and  
 25X1D propulsion test facilities (48-26N 34-59E), cov-  
 25X1D ered by TALENT photography of [REDACTED]  
 and KEYHOLE photography of [REDACTED]  
 include a Main Plant Area, New  
 Plant Area, and Static Test Area located on the

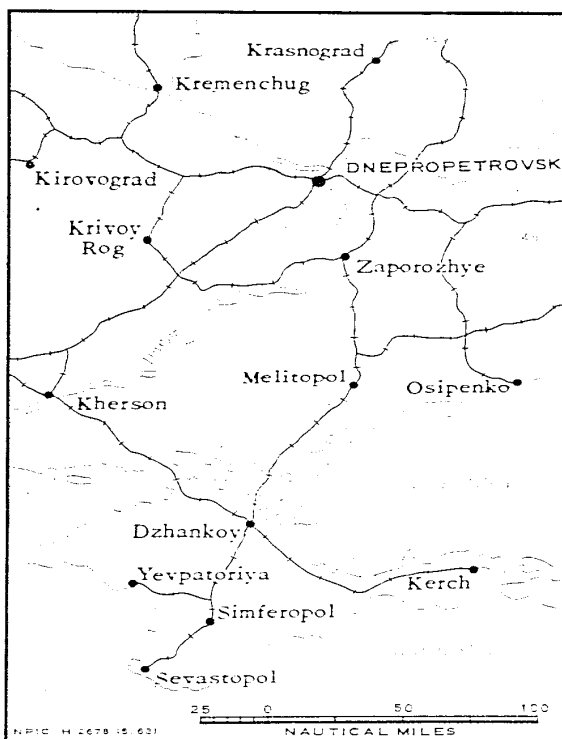

FIGURE 1. LOCATION MAP.

southern edge of the city of Dnepropetrovsk (Figure 1). The Main Plant Area, commonly known as the DAZ Plant, was constructed between 1945 and 1949 to produce ZIS-150 trucks but has never had an important role in the motor vehicle industry. Photographic interpretation and collateral information indicate that production is diversified. Since [REDACTED] the plant has been engaged in the production of rocket engines, and probably complete missiles; agricultural tractors and household refrigerators are also probably produced at the plant.

The Main Plant Area, New Plant Area, and Static Test Area, occupying a total area of approximately 970 acres, are the major components of the installation (Figure 2). Total roof cover of the major buildings in the three areas is about 7 million square feet, making it the largest installation of this type in the USSR. The plant and testing areas are separately secured by fences or walls, and interior portions of each area are also separately secured. All three areas have connections to the general road and rail networks serving Dnepropetrovsk. Air support is provided by the Dnepropetrovsk/Valoshkoye Airfield, 6 nautical miles (nm) to the southeast. Electric power is supplied by the Dnepropetrovsk Heat and Power Plant (TETS Vehicle), connected to the Dnepr Donets power network. Water is taken from the Dnepr River, and is also probably recycled from a reservoir south of the installation for flushing purposes in the Static Test Area. Housing is restricted generally to that available in Dnepropetrovsk and its environs.

## MAIN PLANT AREA

The Main Plant Area (Figure 3), designated as Plant Post Box 186, has an area of approximately 545 acres and its major buildings (Table 1) have a total roof cover of about 5,253,800 square feet. No rail-through buildings can be identified in the area. A possible power plant is the largest of six buildings located in a fenced area measuring approximately 1,090 by 420 feet at the southeast corner of the Main Plant Area; the power plant may be rail served, but positive identification of a spur into the area cannot be made due to the small scale of the photography. A second internal secured area, measuring approximately 490 by 260 feet and containing three small sheds, is located at the western extremity of the Main Plant Area; the sheds are served by

two single-track rail spurs which connect with a holding yard nearby. The dimensions and functions of numerous other small buildings within the Main Plant Area cannot be determined from available photography or collateral information.

Other significant facilities within or associated with the Main Plant Area (Figure 3, Items A--I, respectively) include a possible tractor park, a fire station, a personnel office, the Trust 17 Main Office, a car park, two horizontal cylindrical tanks, three cooling towers, a probable fuel yard, and a sports arena. A large garage (Figure 3), measuring 385 by 295 feet, is situated in a fenced area outside the southeast extremity of the Main Plant Area.

## NEW PLANT AREA

The New Plant Area (Figure 4), designated as Plant Post Box 192, has an area of approximately 155 acres and its major buildings (Table 2) have a total roof cover of about 1,434,475 square feet. Adjoining the Main Plant Area on the southwest, and actually an expansion of it, the New Plant Area is often mistaken for the British-built (1957) tire and rubber plant 2 nm

to the south. An assembly building measuring 1,335 by 530 feet, with a rail-served high-bay section on its northern side, is the largest structure in the New Plant Area; the rail spur at the

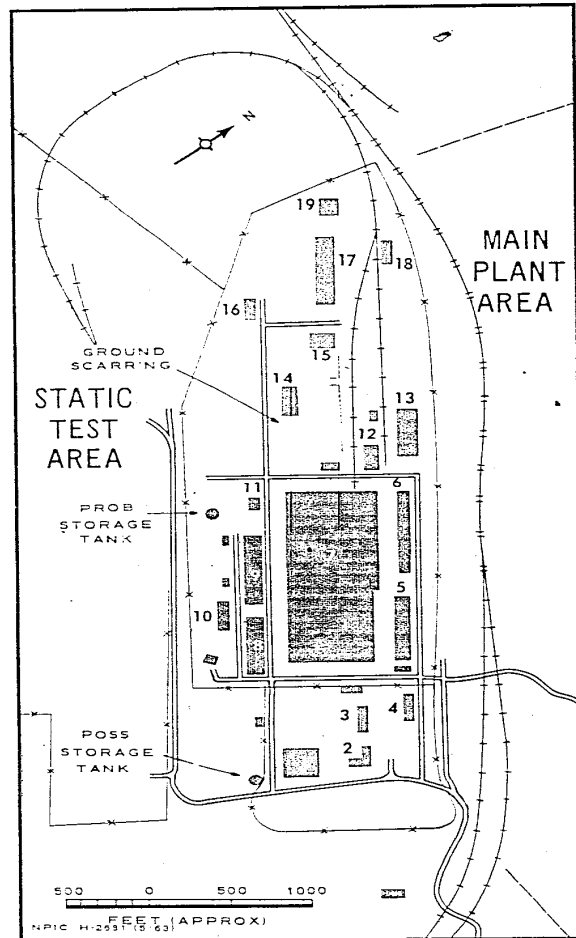

FIGURE 4. NEW PLANT AREA.

northwest end of the high-bay section does not pass through the building, but does connect with a single-track spur serving the Static Test Area. A separately fenced administrative area measuring 1,040 by 980 feet is located at the northeast end of the New Plant Area. The administrative

area contains four buildings with a total roof cover of 111,250 square feet, and several smaller unidentified buildings. Road access to the New Plant Area is effected through the administrative area.

#### STATIC TEST AREA

The Static Test Area (Figure 5), which contains three large vertical stands for testing liquid propellant, is located west of the New Plant Area. It has an area of approximately 270 acres and its major buildings (Table 3) have a total roof cover of about 176,650 square feet. Included within the test area are a probable fabrication/shipping building, assembly/check-out buildings, a possible LOX plant, a number of liquid storage tanks, and various storage buildings and other support facilities. The probable fabrication/shipping building is served by a single-track rail spur, which connects with spurs serving the Main Plant Area and the New Plant Area. The possible LOX plant at the southeast end of the Static Test Area is secured by a separate fence and contains nine buildings, the largest of which measures about 200 by 60 feet (Figure 5, Item 11). The only road access to the test area and the possible LOX plant (35 to 40 feet wide and probably paved) passes through the New Plant Area from the Main Plant Area. Roads inside the Static Test Area average about 25 feet in width and are probably concrete surfaced; the maximum turning radius is 110 feet.

Test Stands A and B (Figure 5, Items A & B), situated on the edge of a ravine 50 to 75 feet deep, are approximately 1,850 and 2,460 feet northwest of the possible LOX plant. Paved blast deflectors extend from the bases of the stands to the bottom of the ravine. Parking for vehicles and other ground support equipment is provided by paved

areas adjacent to the stands. Test Stand C (Figure 5, Item C) is situated on level ground about 1,500 feet northwest of Test Stand B. A sloping trough-like excavation in front of the stand appears to be equipped with piping and collection or drainage devices, possibly for flushing propellants or the deflection and evaporation of materials such as flourine. Probable observation bunkers (Figure 5, Item D) are situated on the south side of the ravine opposite Test Stands A and B. A semiburied tank (Figure 5, Item E) near Test Stand C measures approximately 90 feet in diameter. The number of bays in the test stands cannot be determined and there is no evidence of additional stands under construction. Dimensions of the test stands are as follows:

Test Stand A - length 100 ft, width 70 ft, height 85 ft, overall height 140 ft; blast deflector excavation 375 by 80 ft, depth undetermined

Test Stand B - length 100 ft, width 70 ft, height 70 ft, overall height 140 ft; blast deflector excavation 160 by 85 ft, depth undetermined

Test Stand C - length 150 ft, width 70 ft, height 65 ft, overall height 140 ft; blast deflector excavation 150 by 90 ft, depth undetermined

Test Stand A is comparable in size to the largest stands at the Krasnozavodsk test complex near Zagorsk; Test Stand B resembles the stand at

Kurumoch; and the blast deflector excavation at Test Stand C is similar to the possible test facilities at Voronezh.

Two probable horizontal propellant storage tanks, 100 feet long and 20 feet in diameter, are situated in earthen revetments measuring 280 by 75 feet at the northwest extremity of the Static Test Area. A vertical storage tank 60 feet in diameter and four small buildings or possible

horizontal liquid storage tanks are located south of the revetted tanks. Possible pipelines extend from all these tanks to the test stands. Other possible liquid propellant storage facilities include two vertical tanks and an area containing several buildings, about 1,450 feet south and 1,750 feet southeast, respectively, of Test Stand C.

#### 25X1D CONCLUSIONS

The proximity and interrelationship of the plant and testing areas indicate that the installation is probably engaged

25X1D

The addition of the New Plant Area and the Static Test Area has more than doubled the

acreage and building count at the installation since 1945. The possible LOX plant and large vertical test stands, with related storage and support facilities, suggest that high-thrust rocket engines using liquid oxygen are tested. The production of propellants may involve chemicals and processes utilized at the tire and rubber plant south of the New Plant Area.
